                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders

                                 CC nucleic acid probes for measuring gene expression in a sample derived control acid probes for measuring gene expression in a sample derived control man breast and BT 474 cells. The method involves contacting the grobes with a collection of detectably labelled nucleic acids derived control man breast, and then measuring the label bound to each control man breast, and then measuring the label bound to each control man breast, and then measuring the label bound to each control man breast, and then measuring the label bound to each control man breast discovery, and for determining prediston and/or control man breast disease. Gene expression analysis is useful for control man breast disease. Gene expression analysis is useful for control man breast disease. Gene expression analysis is useful for control man breast a far greater diversity of probes for measuring control man breast a far greater diversity of probes for measuring control man breast a far greater diversity of probes for measuring control matter and the suitable for rapid production of functional control matter acid probe of the invention. Note: The sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this control form part of the printed specification, but was obtained control electronic format directly from MIPO at control of the production of the control of the printed specification, but was obtained control of the production of the control of the printed specification, but was obtained control of the production of the printed specification and the control of the printed specification and the control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      26-MAY-2000;

                                                                                                          The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be
                                                                                                                                                                                                                                     gene
                                  involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which hassociated with coronary heart disease. ABS25101-ABS51005 represent hum liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                            WPI;

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the prob hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygence soft the human breast include: breast cancer, disorders of development, inflammatory diseases of the breast cancer, disorders of proliferative breast disease and nor carcinoma tumours. Note: The sequence data for this patent did not form

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a CC collection of detectably labeled nucleic acids derived from human lung CC mRNA, and (b) measuring the label detectably bound to each probe of the CC array; identifying exons in a eukaryotic genome, comprising (a) CC the eukaryote; and (b) detecting specific hybridisation of detectably CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe (CC having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, CC comprising (a) identifying exons from genomic sequence by the method CC dabove and (b) measuring the expression of each of the exons in several CC tissues and/or cell types using hybridisation to a single exon CC microarrays having a probe with the exon, where a common pattern of CC expression of the exons in the tissues and/or cell types indicates that CC the exons should be assigned to a single gene; a peptide comprising one CC 12011 sequences, mentioned in the specification, or encoded by the CC probes/open reading frames (ORF). The probes are used for gene expression CC lung derived mRNA and for the study of lung diseases such as asthma, lung CC and the probability of the contractive human contractive huma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypercension and hyaline membrane disease. The present sequence is a single exon probe open reading frame of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
Human colon cancer antigen encoding cDNA SEQ ID NO:3371.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 132 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample

For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated with inspiror the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AM37196 to AM37204 and AB77789 represent sequences used in the exemplification of the present invention. N.B. /note="Toyan: aorta; Site 1: DpnII; CDNA
/note="Toyan: aorta; Site 1: DpnII; Site 2: DpnII; CDNA
was prepared from whole aorta divided in atherosclerotic
plaque prone regions (aortic arch and abdominal aorta
proximal part) and less plaque prone regions (descending
thoracic aorta and abdominal aorta distal part). CDNA was
fragmented with DpnII, linker ligated and amplified to
generated starting material for representational
difference analysis (RDA). The two cDNA pools were
subjected to iterative RDA subtraction and amplification
to enrich for gene fragments differentially expressed at
early stages of atherosclerosis."

/note="Organ: pooled; Vector: pT773D-Pac (Pharmacia) with a modified polylinker; Site 1: Not I; Site 2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI CGAP GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "

/note="Vector: pBluescript SK-; Site_1: EcoRI; Site_2:
XhoI; At the trifoliate stage, M. truncatula plants were
transplanted to phosphate-free sand and grown for a
further 30 days. During this period, they were fertilized
twice weekly with 1/2 Hoaglands solutions containing 20uM
potassium phosphate. cDNA was prepared from polyA+
enriched RNA. The cDNA was directionally ligated into the
Unizap XR vector from Stratagene and packaged using
Gigapack III Gold packaging extracts. Plasmids containing
cDNA inserts were excised from the recombinant lambda-Zap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             phage using Ex-assist helper phage and propagated in XLOLR cells."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; RET16; intracellular signal; inflammation-related disease; asthma; rheumatoid arthritis; psoriasis; multiple sclerosis; neuroprotective; transplant rejection; chronic obstructive pulmonary disease; TNF-alpha; inflammatory bowel disease; Croni's disease; immunosuppressive; cancer; inacute respiratory distress syndrome; cardiant; ulcerative colitis; autoimmune disease; cystic fibrosis; gene therapy; cytostatic; neoplasm; cellular migration disorder; cell proliferation disorder; calcification; hyperinsulinaemia; diabetes type 2; systemic lupus erythematosus; tumour; cardiovascular disease; Wegener's granulomatosis; atherosclerosis; thalassaemia; vasotropic; gene; ds.
The invention relates to human, mouse or raft RET16 genes and proteins, involved in intracellular signaling cascade. The RET16 protein or polynucleotide is useful for treating an inflammation-related disease or disorder, e.g. rheumatoid arthritis, juvenile arthritis, psoriasis, asthma, ischaemia-reperfusion, multiple sclerosis, rejection of organ or tissue transplants, chronic obstructive pulmonary disease, inflammatory bowel disease, Crohn's disease, ulcerative colitis, inacute respiratory
                                                                                                                                                                                                                                              New human, mouse or rat RET16 genes and proteins, involved in intracellular signaling cascade, useful for in gene therapy, par for treating e.g. ischemia, cystic fibrosis, autoimmune disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-FEB-2001; 2001US-0269366P
